Hi Browser Company team!

Your posting reads a lot like Marvin's charter. Marvin is the agent platform I built at Attain, and 116 people across engineering, support, and operations use it, about 50 of them every week.

It reviews merge requests – 2,100+ reviews so far, 87% positive across 300+ ratings – and it investigates production alerts. When it finds the bug, it opens a merge request with the fix, and those are mergeable as written 95% of the time. Each agent runs as an ephemeral worker on Kubernetes from a Nix-built image, with the user's own OAuth credentials and Cedar policies deciding exactly which tools it can touch.

And to make all of it cheaper and faster, I built a production-replay eval harness with frozen dev and holdout cases and a version-pinned judge. It let me move review onto open-weight models: cost per review fell 16× in a month, and median review time halved.

So treating the software factory as a product, with real metrics on its latency and cost, is exactly the work I'd love to do next. I'm based in Santa Barbara.

Thanks so much for reading!
